

## 1B, 2B & 3B Solar Perimeter Alarm Beams

The **Dual Detection Technology** works by having a pair of Detectors (set 60 mm apart from each other) on each Beam, both Detectors have to be breached simultaneously to create an activation, allowing small animals, insects, leaves & debris to safely pass by.

### 1B, 2B or 3B (which ones)

There are a pair of detectors on each size of Beam, so these 1B-100 have one pair of detectors, a 2B-100 would have two pairs and the 3B-100 would have three pairs, each pair of detectors work independently of each other resulting in the 3B-100 Beams having three chances to detect an Intruder.

The choice is between choosing the size of the Beams and the qty of dual detection Beams (1,2 or 3).
